# Express Messages

The *express-messages* module provides flash notification rendering.

## Installation

```
$ npm install express-messages
```

## Usage

### Express 2.x

To use simply assign it to a dynamic helper:

```
app.dynamicHelpers({ messages: require('express-messages') });
```

## Express 3+

Install [connect-flash](#) and add them as middleware:

```
app.use(require('connect-flash')());
app.use(function (req, res, next) {
  res.locals.messages = require('express-messages')(req, res);
  next();
});
```

## Adding Messages

On the server:

```
req.flash("info", "Email queued");
req.flash("info", "Email sent");
req.flash("error", "Email delivery failed");
```

For further information see [connect-flash](#).

## Rendering Messages

Call the `messages()` function as specified by your rendering engine:

[EJS](#):

```
<%- messages() %>
```

[Jade](#):

```
!= messages()
```

Which will output the HTML:

```
<div id="messages">
  <ul class="info">
    <li>Email queued</li>
    <li>Email sent</li>
  </ul>
  <ul class="error">
    <li>Email delivery failed</li>
  </ul>
</div>
```

## Using a custom template

Alternatively you can specify a custom template (a file in the views directory of your [Express](#) app).

### Add a message template

For example, lets use the below custom message template named `my_message_template`.

[EJS](#) ( `my_message_template.ejs` ):

```

<div id="messages">
<% Object.keys(messages).forEach(function (type) { %>
  <ul class="<%= type %">
    <% messages[type].forEach(function (message) { %>
      <li><%= message %></li>
    <% }) %>
  </ul>
<% }) %>
</div>

```

**Jade** ( `my_message_template.jade` ):

```

.messages
  each type in Object.keys(messages)
    ul(class="#{type}")
      each message in messages[type]
        li= message

```

## Call the message template

Next, pass the template name, `my_message_template`, as a parameter to the `messages()` function.

**EJS:**

```

<%- messages('my_message_template', locals) %>

```

**Jade:**

```

!= messages('my_message_template', locals)

```

The message template will receive an object called `messages` of the form:

```

{
  "info" : [
    "Email queued",
    "Email sent"
  ],
  "error": [
    "Email delivery failed"
  ]
}

```

## Running Tests

```

$ npm test

```
